

Interview & Scenario-Based Questions (Excel Revision)

These questions revise everything you've covered so far: Aggregate Functions, Logical Functions, Text Functions, Date & Time, Lookups, Dynamic Arrays, Error Handling, Conditional Formatting, and Data Cleaning.

Scenario 1 – Sales Report

A dataset contains **Order ID, Region, Product, Revenue, Profit, Order Date**.

Question: Calculate the total revenue generated by the North region.

Expected Function: SUMIF() or SUMIFS()

Scenario 2 – Customer Orders

Each row contains **Customer ID** and **Order Amount**.

Question: Count customers whose orders are greater than ₹50,000.

Expected: COUNTIF() or COUNTIFS()

Scenario 3 – Performance Classification

Dataset: Revenue column.

Question: Categorize revenue as High (>100000), Medium (50000–100000), Low (<50000).

Expected: IFS() or Nested IF()

Scenario 4 – Employee Bonus

Give a bonus only if Revenue > ₹100000 **and** Profit > 20%.

Expected: IF(AND())

Scenario 5 – Regional Marketing

Offer a campaign if Region is North **or** West.

Expected: IF(OR())

Scenario 6 – Customer Name Cleaning

Customer names contain inconsistent casing and extra spaces.

Question: Standardize them.

Expected: PROPER(TRIM())

Scenario 7 – Email Analysis

Extract usernames and domains separately from company emails.

Expected: LEFT(), MID(), FIND()/SEARCH()

Scenario 8 – Phone Number Cleaning

Phone numbers include spaces and hyphens.

Question: Convert them into a consistent 10-digit format.

Expected: SUBSTITUTE()

Scenario 9 – Order Date Analysis

Extract Month and Year from Order Date.

Expected: MONTH(), YEAR()

Scenario 10 – Weekend Orders

Highlight orders placed on weekends.

Expected: WEEKDAY()

Scenario 11 – Employee Lookup

Find an employee's department using Employee ID.

Expected: XLOOKUP() (or VLOOKUP() if required)

Scenario 12 – Product Price Retrieval

Retrieve product prices even if the lookup column position changes.

Expected: INDEX() + MATCH()

Scenario 13 – Dynamic Region Report

Return only South region records automatically.

Expected: FILTER()

Scenario 14 – Customer Master

Generate a unique customer list from repeated transactions.

Expected: UNIQUE()

Scenario 15 – Sales Ranking

Display products sorted by highest revenue without modifying the original data.

Expected: SORT() or SORTBY()

Scenario 16 – Data Validation

Restrict Status values to **Completed, Pending, Cancelled** only.

Expected: Data Validation (List)

Scenario 17 – Conditional Formatting

Highlight revenue above ₹100000 in green and below ₹50000 in red.

Expected: Conditional Formatting rules

Scenario 18 – Error Handling

A lookup formula returns #N/A when a Product ID doesn't exist.

Question: Display "Product Not Found" instead.

Expected: IFERROR()

Scenario 19 – Data Cleaning Challenge

Using the provided messy dataset:

- Remove extra spaces.
- Standardize names.
- Fix phone numbers.
- Convert revenue to numeric values.
- Remove duplicates.

- Standardize dates.

Explain your step-by-step approach and the functions/tools used.

Scenario 20 – End-to-End Business Problem

A company gives you a raw sales dataset with inconsistent customer names, duplicate records, mixed date formats, missing values, and asks you to create a monthly revenue report.

Question: Explain the complete workflow from receiving the data to delivering the final report.

A strong answer should mention:

1. Data Cleaning
2. Text Functions
3. Date Standardization
4. Error Handling
5. Data Validation
6. Conditional Formatting
7. Dynamic Arrays (where appropriate)
8. Aggregate Functions
9. Lookup Functions
10. Preparing the dataset for Pivot Tables and Dashboards

This final scenario tests not just formulas, but whether a candidate understands the complete data preparation process used in real analytics projects.
